CastleHub Screen Plan

Oct 20, 2026 · @Abou Bakar

CastleHub combines Peerlist's three-column social layout with Product Hunt's ranked launch lists. It has 8 screens, built in Next.js App Router, TypeScript and Tailwind CSS.

Research method

REA captured 8 desktop pages across the two sites. It captured no mobile layouts and no pages that need a login.

- **Headless Chrome was blocked.** Both sites showed only a Cloudflare security-check page. We did not try to get around it.
- **A visible Chrome window worked.** We opened Chrome on a scratch profile with DevTools access turned on. The real pages loaded there, and REA read them through `list_browser_targets`, `inspect_web_page`, `capture_web_screenshot` and `capture_browser_scenario` (connect mode).
- **Mobile was not captured.** The 390px viewport setting was ignored when connected to an existing tab. Product Hunt also refused connect mode with `target_not_allowed`.
- **`verify_reconstruction` has not been run.** It waits until the CastleHub screens exist.

Site	Pages captured	Evidence ID
Product Hunt	Home	ev_e769dcfc…
Product Hunt	Product page, daily leaderboard	ev_598741ec…
Peerlist	Home (logged out)	ev_cf85ba3a…
Peerlist	Scroll feed, Launchpad	ev_02420ef7…
Peerlist	Project page, builder profile	ev_05b3ff58…
Both	Headless Chrome blocked by Cloudflare	ev_cb6f1413…
Peerlist	Mobile attempt (rendered at desktop width)	ev_b8b16c9a…

Observed patterns

Both sites build discovery around the same ranked row: icon, name, tagline, tags and an upvote count in a box. Everything below was seen in the captures.

Site	Screen	What it shows
Product Hunt	Header	Logo, search, menus (Best Products, Launches, News, Forums), Subscribe, Sign in
Product Hunt	Home	Sections for today, yesterday, last week, last month. Rows: rank and name, tagline, 2–3 category links, comment-count box, upvote-count box. Newsletter box in the list, forum-threads sidebar, category footer
Product Hunt	Product page	Icon, name, tagline, followers, Visit website. Tabs: Overview, Launches, Reviews, Alternatives, Built with, Team, Awards. Day-rank card with a full-width upvote button. Comments with Upvote, Report, Share
Product Hunt	Leaderboard	Daily, Weekly, Monthly, Yearly tabs, a date picker, Featured/All toggle
Peerlist	Layout	Three columns. Left menu (Scroll, Launchpad, Jobs, Search, Blog, Advertise) with a theme toggle. Sticky title bar in the middle column. Right column: ad, featured launch, active discussions
Peerlist	Scroll (feed)	Newest and Trending tabs, each its own URL. Hideable launch-day banner. Post box with 4 attachment buttons. Post card: avatar and verified badge, name, @handle, #channel, time, title, text with Read More, images, upvote/comment/repost/bookmark, “X & 2 others upvoted”, one inline comment
Peerlist	Launchpad	One URL per week (/launchpad/2026/week/43). Scrolling week tabs, week dates, Launch button, Categories, Top Builders. Rows: icon, name, tagline, comment and bookmark counts, tags, upvote box
Peerlist	Project page	Centred icon, name, tagline, maker, Visit and Upvote buttons. Image gallery, categories, description, Comments/Upvotes tabs, newest-first comments with Like and Reply. Right column: weekly rank badge, supporters, ratings

Site	Screen	What it shows
Peerlist	Profile	Sticky bar: name, followers, Follow. Avatar, job title, join date, website link, skill chips. Work, Resume and Posts tabs, each its own URL. Projects use the Launchpad row
Peerlist	Home (logged out)	Claim-your-username box, member avatar wall, feature sections, footer

Screen plan

All 8 screens share 7 components, one file each: Avatar, UpvoteButton, ProjectRow, PostCard, TabLinks, TagList, RightRail. Data starts as typed mock data in `lib/data.ts`, swapped for a real backend later.

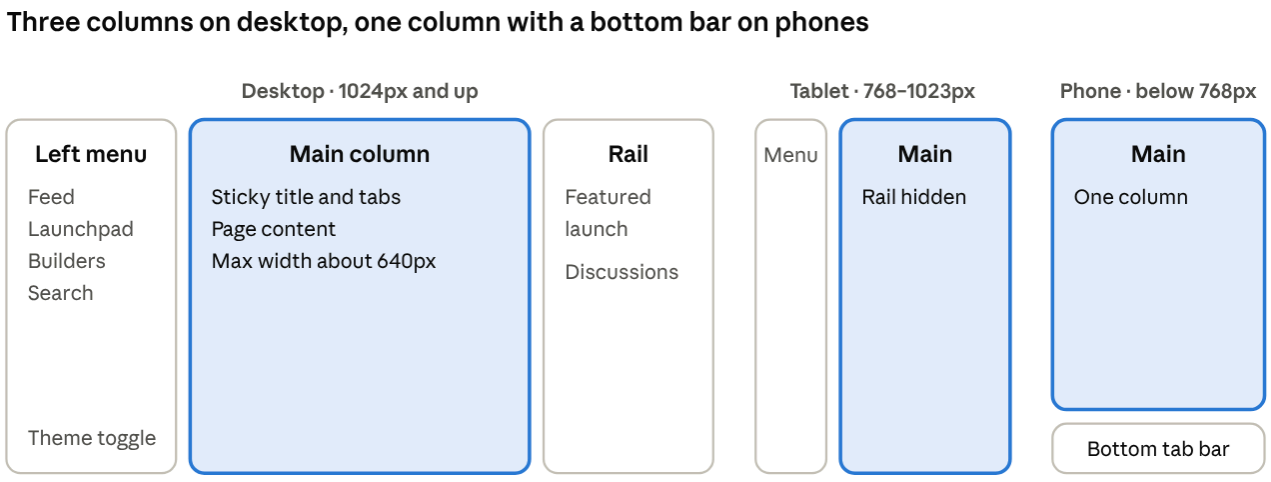

#	Screen	Route	What it holds	Based on
1	Landing (logged out)	`app/page.tsx`	Hero, claim-your-username input, builder avatar wall, 3 feature sections, footer	Peerlist home
2	Feed	`app/(main)/feed/page.tsx`, `/feed/trending`	Post box (text, image, link). PostCard: avatar and badge, name, @handle, #channel, time, title, text with Read more, images, upvote/comment/share/bookmark, who-upvoted stack, top comment	Peerlist Scroll
3	Post page	`app/(main)/post/[id]/page.tsx`	One PostCard with the full comment thread	Peerlist /scroll/post/[id]
4	Launchpad	`app/(main)/launchpad/[year]/week/[week]/page.tsx`	/launchpad redirects to the current week. Week tabs, dates, Launch button, ?category= filter. ProjectRows ranked by upvotes	Peerlist Launchpad, Product Hunt leaderboard
5	Project page	`app/(main)/[handle]/project/[slug]/page.tsx`	Centred header with Visit and Upvote. Gallery using CSS snap-x, no carousel library. Categories, description, Comments/Upvotes tabs. Right column: week rank and supporters	Peerlist project page
6	Builder profile	`app/(main)/[handle]/page.tsx`, `/posts`	Sticky mini header with Follow. Avatar, headline, join date, website link, skill chips. Projects tab (ProjectRow) and Posts tab (PostCard)	Peerlist profile
7	Publish a project	`app/(main)/launchpad/new/page.tsx`	Name, tagline (60 characters max), URL, icon, up to 4 images, categories, description. Native form, Server Action, validated on the server	Not observed (needs login)

#	Screen	Route	What it holds	Based on
8	Search	`app/(main)/search/page.tsx`	One input with ?q=, results grouped by builders, projects, posts	Not observed

Leave out for now: Product Hunt's Reviews, Alternatives, Built-with and Awards tabs, a Resume tab, and video, poll and article posts. Add them when someone needs them.

App shell

Every signed-in screen sits in one shell, `app/(main)/layout.tsx`, modelled on Peerlist's layout. Tabs are plain links to separate URLs, as on both sites, so the server can render each tab and no tab-switching JavaScript is needed.

app shell · 3 breakpoints

The desktop layout matches Peerlist. The tablet and phone layouts are planned, not observed, and should be checked against real mobile captures.

Build order and verification

Build the shared row first, because Launchpad, the project page and the profile all reuse it.

1. App shell
2. ProjectRow and UpvoteButton
3. Launchpad
4. Project page
5. Builder profile
6. Feed and PostCard, then the post page

7. Publish form
8. Landing page
9. Search

Verification, once the screens exist:

1. Capture CastleHub with the same REA browser scenarios used on the reference sites.
2. Compare against the reference captures with `compare_web_screenshots` and `compare_web_captures`.
3. Run `verify_reconstruction`.

Branding: CastleHub uses its own colours, logo and copy, not Peerlist's green or Product Hunt's coral.

Open questions:

- [ ] Which backend and login method? This decides the publish form and how upvotes are stored.
- [ ] Capture real mobile layouts by opening both sites in Chrome DevTools' phone view, so REA can inspect them passively.
